Kick-off meeting memo

Group 5 - Blockchain Blockers

Communication

Mostly we are going to use WhatsApp for communication in addition to speaking in class. GitHub can be used to exchange more technical, project-related notes and messages to with each other.

GitHub is also used for file version control, and overall project control with different columns for to-do, in-development and finished parts of the project. Parts of project in the Project-board are controlled through issues, which enables us to return to previously finished parts easily.

Technical

The main focus of the project is its database and the program that is used to write and read data to and from the database.

We are going to use MySQL for developing the database and it is going to be designed in MySQL Workbench which has excellent visual database design tools. From Workbench we can export a finished code for the creation of the database.

A main program is used for writing and reading data to and from the database. The main program is most probably going to run on the same server where the database is running. The program will be written in C# and compiled in to a .NET program.

Documentation

Documents will be written in Google Docs, which enables simultaneous editing across group members. The documents will be collected to the GitHub projects. We might also write a wiki from the different parts of the project, that is going to be decided later as the project continues.
